FlexiSign's tried-and-true 1-1 voice mail system, which can be expanded to become a 3-way intercom system, is available as both an internal and external voicemail box. A full-featured firmware upgrade option puts a host of innovative features at your fingertips. The installation and setup instructions are included with the product. Printing Analog printing has been steadily reducing in importance, giving way to the dominance of digital printing. For example, in the 1970s, a typical retail store would print small promotional brochures using offset lithography at home; today, it would print the same information on a digital press using a high-volume, short-run production line. Environmental impacts Historical printing methods used water in the printing process that produced toxic waste through the buildup of certain solvents and inks, and the use of oil-based ink that created solid waste. However, the advent of photopolymer materials and inkjet printing has made printing cleaner and greener.

Environmental issues in the printing industry are not necessarily specific to the printing process; they include such environmental factors as water, fuel, electricity, and paper. Energy use from the most important environmental point of view is heat or power, and in the manufacturing of color prints, it is often needed to pass a print job through multiple, different energy-consuming stages of production. Electronic waste is created by outdated machines, worn-out or broken up printers, and highly toxic chemicals and solvents. Paper waste comes from torn-up paper, and from ink and toner. Paper-based printing Paper represents a significant proportion of the earth's biosphere, providing an inexpensive way of producing a wide variety of materials. Paper-based materials are increasingly substituted for other materials due to their lower cost and limited availability. The most common materials for paper include: Wood-pulp. Used in the manufacture of magazine, newspaper and other printed paper. Recycled fibers. Used to make corrugated, cardboard and new paper. Cellulose fiber. Used in the manufacture of special papers such as photographic or fine art print papers and labels. Paperboards. Used in the manufacture of boxes, corrugated and milk cartons, and as a substrate for contact printing. Wood. Used in printing books and prints. Approximately 32% of paper used in the United States
